Ttech Task

Delivery during Three days from receiving time

- Create an application that simulates the registration process, there is a registration page that takes the name, age, phone number, email and a unique company name, then the user will submit the page.
- After submitting the page, the application should create a separate database for each user with the log in information and a dummy table called data which contains name, phone and address.
- There will be a log in page which takes the username and password from the user and displays data from his own database if the authentication data is valid.
- The application should implement the CRUD operations on the user's own database

Required technologies:

Either dot net core API and Angular, or dot net core MVC, but dot net core API and Angular is preferred.

Good Luck 😊
